General Structure
Case: Flame-resistant resin Color: Light gray
Front panel: Membrane sheet
Adjustment: Using the front keypad
(1) Press the MODE Key. The ZERO indicator becomes lit. The unit moves to the Potentiometer input ZERO adjustment mode.
(2) Set the potentiometer to any position, and press the DOWN Key once.
The automatic adjustment will be performed, then the ZERO position will be registered.
Press the MODE Key.
The SPAN indicator becomes lit, and the unit moves to the Potentiometer input SPAN adjustment mode.
(3) Set the potentiometer to any position (larger than the ZERO position) of MAX side, and press the UP Key once. The automatic adjustment will be performed, then the Span position will be registered.
(4) Pressing the MODE Key returns to Step (1).

If the MODE Key is pressed for approx 3 sec , or if no operation occurs for approx. 30 sec , the unit will revert to the RUN mode.

## Indication:

PWR indicator (Green):
Lit when power is turned ON.
Flashes in 0.5 second cycles if non-volatile memory errors occur.
Flashes in 0.25 second cycles if input errors occur.
ZERO indicator (Yellow):
Lit in the Output ZERO adjustment mode.
SPAN indicator (Yellow):
Lit in the Output SPAN adjustment mode.

## - Attached Functions

Power failure countermeasure:
The data is backed up in non-volatile IC memory. Self diagnosis:
The CPU is monitored by a watchdog timer, and when an abnormal status is found on the CPU, the unit is switched to warm-up status turning all outputs OFF.
